Abstract

English is the world language. Most countries in the world including Cambodia have adopted this language into their school curriculum. Thus, learning English has become an essential need for many people in Cambodia and the world. There are many factors contributing to the success of English language education. One of the most important components is motivation. There are 14 two types of motivation including intrinsic and extrinsic ones. 1 The present study employed a quantitative design and aimed to examine if there were statistically significant differences amongst Cambodian Buddhist monk students' motivation in learning English. 93 Cambodian Buddhist monk students learning at a Cambodian Buddhist primary school participated in the study. The results show that there were statistically significant differences of students' motivation from different grades. Finally, a study with a larger sample size is recommended. A qualitative study to explore students' motivation in learning English is also recommended.

Keywords: Cambodia, Buddhist Primary School, Buddhist Monk, Motivation in Learning

INTRODUCTION

English is an international language or a global language. Thus, if you know English well, it means that you can travel to different countries in the world easily without having the barriers of communication. In Cambodia, English has been used as a foreign language. It has also been included in public school curriculum from Grade 4, and it will also be included in pre-school levels in the short future (MoEYS, 2015). Prior to this, English was brought into Cambodia ⁷ between 1970 and 1975 during the Khmer republic or Lon Nol period (Em & Mao, 2022; Neau, 2003a). However, English and all other foreign language were forbidden from learning and teaching at the start ⁸ of the Khmer Rouge (KR) or Pol Pot regime in 1975 (Clayton, 1998). Neau (2003a) noted that the KR ended in 1979, but the study of foreign languages including English was not allowed to be learned or taught until 1989. Igawa (2008) also noted that the ban of English education at that time was due to the political invasions. Instead, Cambodian students were encouraged to learn Vietnamese and Russian. These days, many English textbooks have been developed to use in the government schools to promote students' motivation in learning English (see Keo et al., 2022).

In Cambodia, the English score in the national exams (Grades 9 and 12) is only a surplus. That means if students receive fewer than 26 points, their scores are equal to zero. However, if they receive 26 or more points, they ⁹ can receive additional points to add to other subjects. For Cambodian national exams, the overall English score is 50. As previously said, the scores from 1 to 25 are equivalent to zero, so if the students wish to receive surplus scores, they must obtain at least 26 points. ⁹ As a result of this form of score-giving, some students become disheartened and lose motivation, which ¹⁰ is one of the key elements in the success of learning the English language.

The key to a successful learning process is motivation, and it is the same for English language learning. Some experts have specific definitions of motivation. Students' motivation is seen to be a key factor in their success in learning English (Dörnyei, 2019; Ehsan et al., 2019). Another definition of motivation is the direction of conduct or factors that lead someone to wish to repeat one activity or another. Additionally, motivation and academic success as measured by evaluation point average are strongly connected from elementary school through college (Locke & Schattke, 2019).

It can be seen from the previous description as a whole that motivation is the fusion of effort and desire, providing justification for people's behaviors, wants, and desires in order to achieve the directions of learning toward an aim (Fry, 2003). Motivation is the term for the causes that underpin willingness and volition of behavior. Motivation is also a collection of closely connected ideas, perceptions, values, interests, and behaviors (Ryan & Deci, 2006). However, by receiving an incentive, students will be enthused about learning and inspired to study English well. Teachers may assist students to become more motivated by making certain adjustments after becoming aware of the importance of motivation in students' language acquisition (Wu & Wu, 2008).

Teachers should obtain an understanding of the harmonies and tensions that predominate in current educational theory via the study of learning theories and their historical evolution (Achinstein, 2002). Unfortunately, students in Cambodia still lack drive to a large extent because they occasionally lack confidence. It happens because, occasionally, teachers do not understand how their students feel about English. Therefore, it is helpful to inform the readers, especially the teachers, of how strong the students' motivation is and what their incentive is. As Boekaerts (1997) noted, because effective learning is exceedingly difficult for students to achieve without a desire to study. It might be claimed that teachers need to be aware of how important it is to inspire students and increase their inspiration.

18 Motivation is essential for learning since, without it, it will be impossible to put learning activities into practice. The level of the students' learning efforts needs to be determined by their motivation. Reward 7 is one of the elements that affects students' motivation. Depending on the kind of appreciation offered and the conditions in which it is delivered, the function of reward may either increase or decrease motivation. Teachers should make an effort to provide their students more autonomy or control over their education. Teachers must also create a learning environment that respects connection, objective context, and outside evaluation (Dörnyei, 2019).

In keeping with the reasoning provided above, we are aware that motivation is seen as success while 11 learning a new language in a classroom setting. Teachers can determine their students' interests by learning about their motivation. Therefore, it is crucial that this study 27 be taken into consideration by those who are involved in English language instruction (see Em, 2022).

As mentioned earlier in this article, 24 there are two types of motivation including intrinsic motivation and extrinsic motivation. As Schneider (2012) noted, intrinsic motivation means the desire that someone wants 18 to do something without being told or forced, while extrinsic motivation is the drive that urges someone to do something in order to reach the goals.

The current study aimed to examine if 33 there were statistically significant differences amongst the Buddhist monk students studying in Grade 4, 5 and 6 at a Buddhist primary school in Cambodia. There have been some studies about English education in Cambodia. Those studies have been conducted by Cambodian and foreign authors regarding the challenges 5 of English language learning and teaching, the macro skills, vocabulary, grammar, or motivation in learning English. We have chosen 16 studies to put in Table 1

as the literature review **1** of this study.

In the above table, we have tried to select some studies that are relevant to English education and motivation in learning English in the Cambodian context. We have also listed those articles based on the years of their publications. That means the older articles were put first. Notably, there are still some more articles regarding 8 English education and motivation in learning English in the Cambodian context, but we found that the articles in the table can mix up the ingredients just now.

METHOD

1 The present study is a part of a bigger study. The study employed a quantitative design. The participants were selected randomly from a Buddhist primary school in Cambodia.

There were 93 Buddhist monk students attended the study voluntarily. All 22 the participants were also informed that they could withdraw themselves from the study at any time if they found that the study was against their privacy or was not confidential.

One way ANOVA and Bonferroni analyses were considered in 10 the present study. The

focus was to examine if there were statistically significant differences among the students learning in Grades 4, 5, and 6 at the target school.

RESULTS AND DISCUSSION

Results

This section presents the results of the study from the data analyses. The demographic information of participants is also presented here.

As revealed in Table 3, the Buddhist monk students reported high motivation in all items (1-10), and the sum of all items shows that the monk students had high intrinsic motivation

1 toward learning English as a foreign language (M=3.8, SD=.52). These results mean

that the participants in the studied context wanted to study English more than normal without being forced.

As revealed in Table 5, there were significant differences in intrinsic motivation variable (Sig = .003). There were also significant differences in extrinsic motivation (Sig = 000). Overall, there were also significant differences when combining 14 the two types of motivation together (Sig = 000). The results mean the students from the three grades had different motivation toward learning English.

As shown in Table 6, the students in Grade 6 were more intrinsically motivated toward learning English than the students in Grade 5. The students in Grade 6 were also more intrinsically motivated toward learning English than the students in Grade 4, and the students in Grade 5 were more intrinsically motivated toward learning English than the students in Grade 4. These results mean that 3 the students in Grade 4 were the least intrinsically motivated toward learning English, while the students in Grade 6 were the most intrinsically motivated.

The students in Grade 6 were more extrinsically motivated toward learning English than the students in Grade 5. The students in Grade 6 were also more extrinsically motivated toward learning English than the students in Grade 4, and the students in Grade 5 were more extrinsically motivated toward learning English than the students in Grade 4. These results mean that the students in Grade 4 were the least extrinsically motivated toward learning English, while the students in Grade 6 were the most extrinsically motivated.

Overall, the students in Grade 6 were more motivated toward learning English than the students in Grade 5. The students in Grade 6 were also more motivated toward learning English than the students in Grade 4, and the students in Grade 5 were more motivated

toward learning English than the students in Grade 4. These results mean that the students in Grade 4 were the least motivated toward learning English, while the students in Grade 6 were the most motivated.

Discussion

The current study was conducted at a Buddhist primary school in Kampong Cham town, Cambodia. There were 93 Buddhist monk students participated in the study. They were from Grades 4, 5, and 6. One way ANOVA and Bonferroni Analyses were utilized during the data analyzing process in order to examine the statistically significant differences among the participants. As a result, there were statistically significant differences among them. The students in Grade 6 were reported as the most motivated in learning English. They were the most intrinsically, extrinsically, and overall motivated, while the students in Grade 4 were the least in all types of motivation including the overall.

The comparison of the current study with the previous studies is not necessary because there have existed no any kind of the current analyses in the Cambodian context. Thus, this type of data analyses in term of motivation in learning English is the first one in the Cambodian context, and it paves the way for future studies using Advanced Statistics analysis.

CONCLUSION

In conclusion, the present study conducted with 93 Cambodian Buddhist monk students in a Buddhist primary found that the students in Grade 6 were the most motivated toward learning English as a foreign language. The students in Grade 4 were reported as the least motivated in all types of motivation, while the students in Grade 5 stand between

those in Grade 4 and 6. As 1 presented in the results, some actions to help those in Grade 4 to improve their motivation in learning English are necessary. Thus, this study also has the following recommendations.

The Ministry of Education, Youth and Sport (MoEYS) of the Kingdom of Cambodia should take the results from the study to consider. There has been no English textbook that helps Buddhist monk students to learn English better. The instructors who teach those students only take the books 2 they want to teach. Therefore, making good textbooks for them is essential. After having their own textbooks, the students will be more motivated 1 toward learning English and their learning achievements will be improved (see Em and Nun, 2022). Besides, MoEYS should include English as a compulsory subject for national exams, not a subject that only serves 14 to earn a surplus anymore. This point benefits all the students, not only the Buddhist monk students.

Education institution is said 1 to be one of the most important characters in improving students' motivation in learning English. Therefore, all the education institutions should encourage students to learn English directly or indirectly. The school leaders 7 can have a date to meet all the students and give some types of awards to those who have done well with their studies, or they can encourage teachers who have worked well and brought fruitful results to the institutions so that those teachers, consequently, help 1 their students to learn well, too. Moreover, Em (2021) noted that the school principals can make an effort to most of the important characters in the society, like students' parents or the community chiefs, in order to inform them to help encourage their children to learn.

Teacher is the most powerful and essential character in the classroom. They can encourage their students to learn English every time they want. Besides, they can conduct action research in their classroom to solve in-hand problems and to improve their students' learning motivation toward great success. The teachers also need to develop their

professional competences through different means ¹⁴ to learn new teaching techniques and apply those techniques with their students (see Em at al., 2021).

Limitation of all studies is the norm. ¹ The present study is not different from the present studies. The participants in the study were still limited. There were only 93 participants attended the study, and the study was conducted at only one place. Thus, a study with a larger sample size at other education institutions is recommended. A qualitative study to explore students' motivation in learning English as a foreign language is also recommended.

²³ ACKNOWLEDGMENTS

We would like to express our deepest thanks to the previous authors who allowed us to use their data for further analysis. Without their permission, this article would not have been appeared by any means. We ⁷ would like to wish them good luck, good health, and longevity.
